Basic EAP Data

Purpose

The purpose of this plan is to prescribe procedures to be followed in the event of an emergency associated with the Atlanta Reservoir No. 1 Dam, which is caused by an unusually large flood, earthquake, a malfunction (hydraulic or structural) of the spillway, malicious human activity such as sabotage, vandalism, or terrorism, or failure of the dam.

This Emergency Action Plan (EAP) defines responsibilities and procedures to:

- Identify unusual and unlikely conditions that may endanger the dam.
- Initiate remedial actions to prevent a dam failure or minimize the downstream impacts of a dam failure.
- Initiate emergency actions to warn downstream residents of impending or actual failure of the dam.

Potential Impacted Area

See *Evacuation Map* tab (Appendix B–5) and *People at Risk* tab (Appendix B–6) for the locations and contact information of the following residents and businesses that may be flooded if the dam should fail and the estimated time for the flood wave to travel from the dam to these locations:

A breach of the dam on the north side of the Reservoir is projected to inundate low lying areas to the northeast between Northside Drive and I-75 and along I-75 near Exit 252A (Northside Drive) as well as northwest towards Marietta Blvd NW. Impacted areas north of I-75 include low lying areas along Tanyard Creek northward to its confluence with Peachtree Creek. At this location, the flood wave should be mitigated by the established flood way.

A breach of the dam on the east side of the Reservoir is projected to inundate low lying areas to the northeast between Reservoir No. 1 and I-75. The approximate northern extent is the CSX railroad immediately north of the reservoirs. To the south, the extent is approximately 14th St NW. Past I-75, the flood wave should be mitigated by the established flood way.

A breach of the south embankment of the Reservoir is projected to inundate areas due south and east in the vicinity of the railroad south of Loring Heights, south of Atlantic Station to and including low lying areas of the I-75/85 Connector. Inundation continues along Tanyard Creek to Collier Rd NW. Past Collier Road NW, the flood wave should be mitigated by the established floodway.

Some roadway bridges may be overtopped along Peachtree Creek as far east as Moores Mill Road NW.

Properties between the Reservoir and I-75 area are primarily zoned for mixed use and residential (both high and medium density). Areas north of I-75 (Collier Hills vicinity) area are primarily zoned for single family residences. Impacted infrastructure includes CSX Railroad and GDOT (I-75/85 at Northside Drive) in addition to City of Atlanta roadways within the inundation area.

Directions to dam (See *Location and Vicinity Map*; Appendix B–3.)

From downtown Atlanta, take the I-75/I-85 Connector north to Exit 251A, 17th Street. Turn left and go west on 17th Street for 1.4 miles. Turn right on Howell Mill Road. The entrance gate to Reservoir No. 1 is on the right. This accesses the top of the Dam and the drain structure.

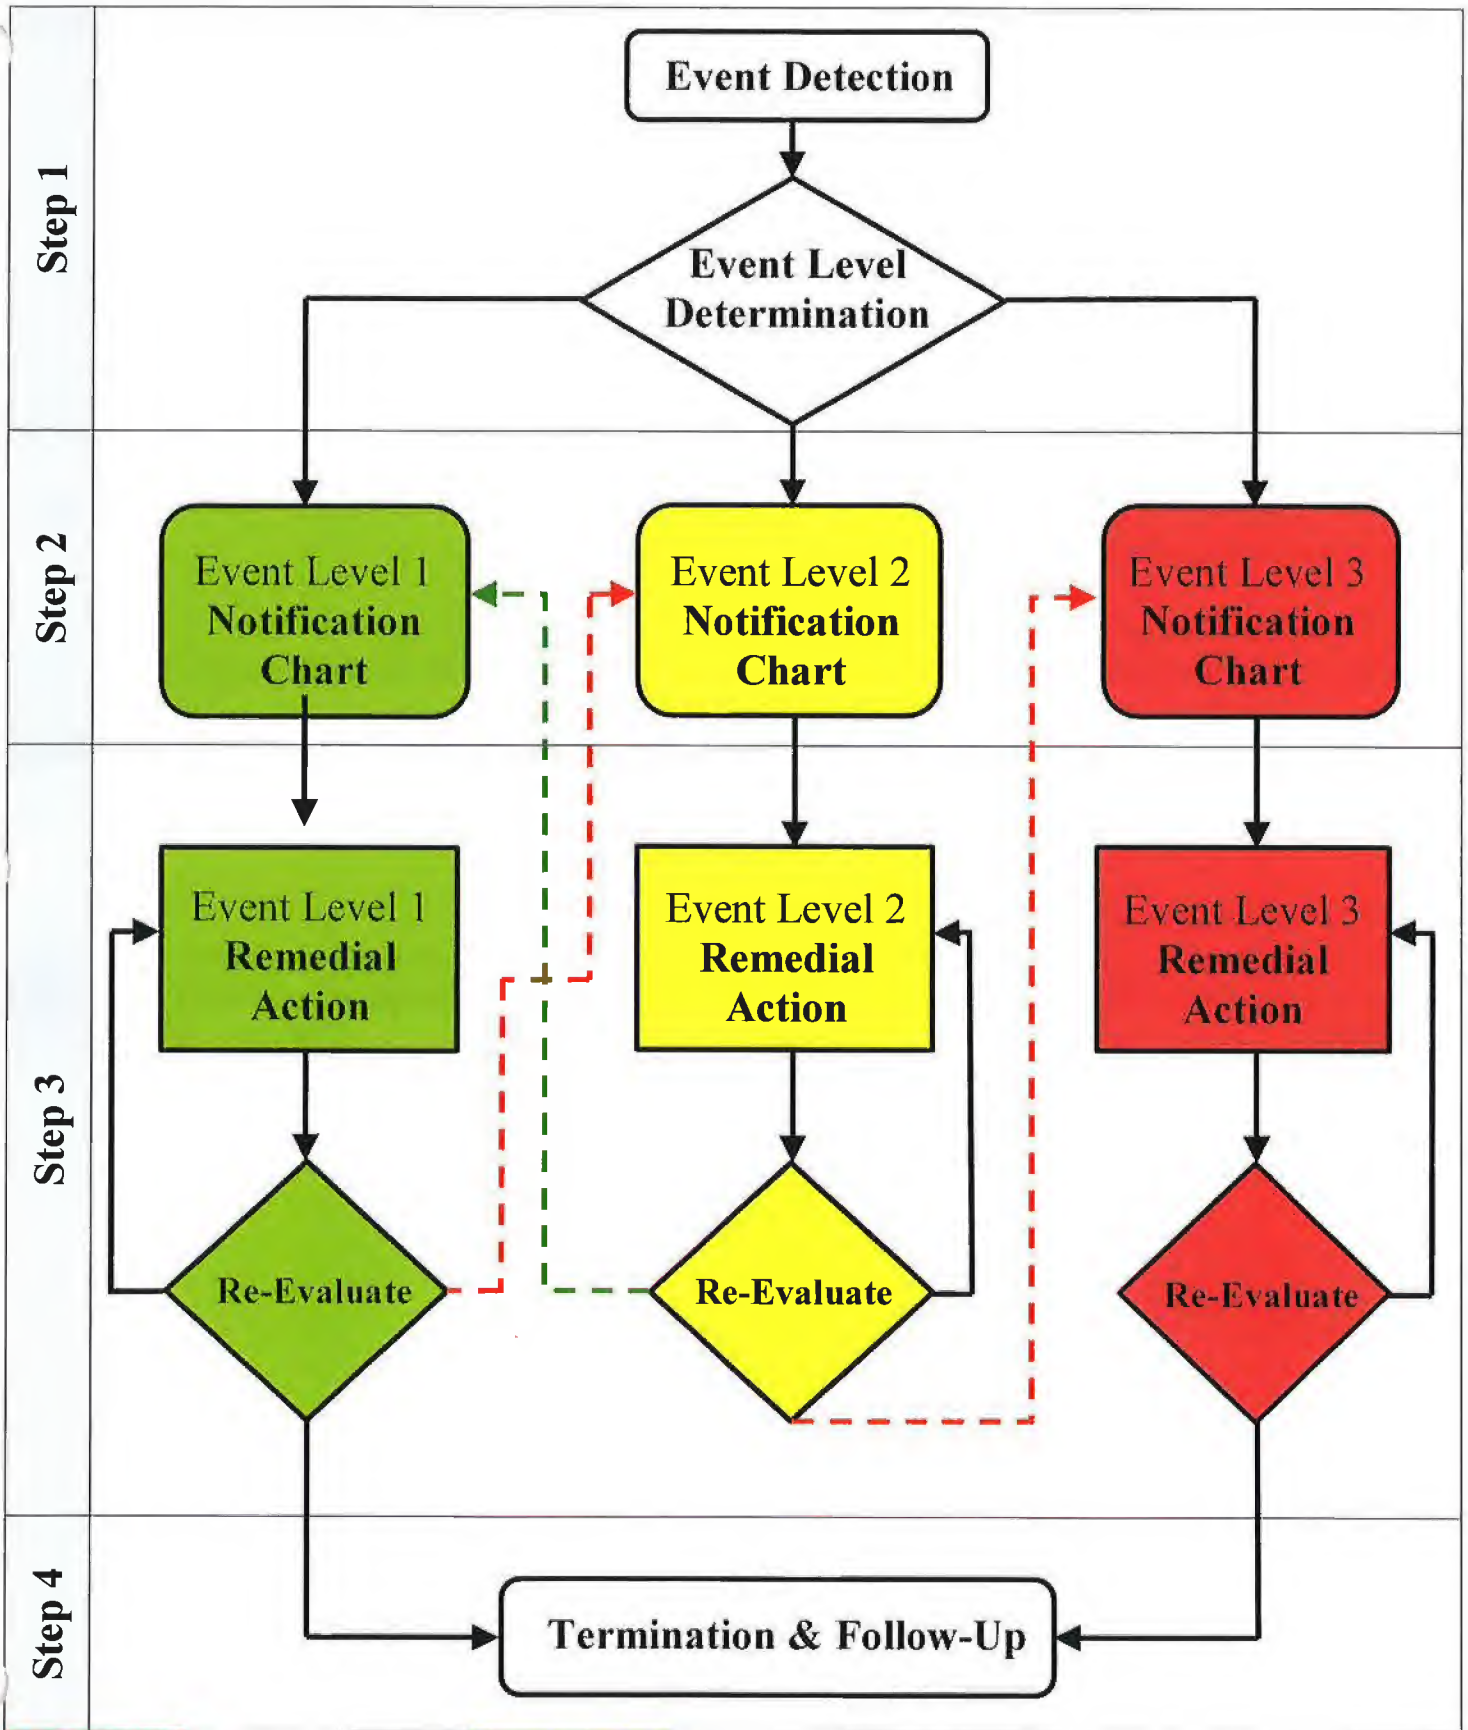

The access gate is secured. For access, contact the City of Atlanta, Department of Watershed Management.

Directions/Additional Information for Appurtenant Structures

Following are general directions for locating appurtenances critical to operating the Reservoir. Additional information regarding the location can be referenced in Appendix B-3, *Location and Vicinity Map*.

- Access Gate - The access gate located on Howell Mill Road provides access to the drain valve/structure. **During an emergency situation, the EAP coordinator shall immediately unlock the gate or direct security to unlock the gate.**
- Drain Valve – **The drain valve is operated via a handwheel. The wheel is not locked. This can be used to lower the water level in the reservoir to relieve pressure on the dam in the event of observed excessive seepage or a small breach.** To access the valve, commence north on Howell Mill Road from its intersection with 17th Street. Turn right into the Access Gate. If the access gate is inaccessible, the Drain Valve may be accessible by foot through the Water Lodge property located on Reservoir Drive. Reservoir Drive may be accessed from Northside Drive or 17th Street NW to the east of the Reservoir.
- Toe of the Dam / Drain Outlet - The toe of the Dam and outlet structure is located at the end of Trabert Ave. To access the toe or drain outlet, commence north on Howell Mill Road from its intersection with 17th Street. Turn right onto Trabert Avenue and proceed to the end.
- Spillway - From downtown Atlanta, take the I-75/I-85 Connector north to the Exit 251A, 17th Street. Turn left and go west on 17th Street for 1.3 miles. Turn right onto Reservoir Drive. The auxiliary spillway is on the left. The spillway may be access from along the top of the dam from the access gate located on Howell Mill Rd.
- Interconnection Valve (**CRITICAL**) – **This valve must be closed immediately if either reservoir dam is at risk of failure or upon breach of either dam to prevent loss of water from both reservoirs. The valve is operated by a handwheel. The wheel is not locked.** The interconnection valve is located at Reservoir No. 2. Commence north on Howell Mill Road from its intersection with 17th Street. Turn left at the entrance gate to Reservoir No. 2 and take an immediate right along the north east top of the Reservoir No. 2 Dam. The valve box structure is on the left approximately 230 feet from the reservoir access road. The Interconnection Valve is the valve located on the east side of the structure. Refer to Appendix B-3 for a location. If access is not available as described, continue straight at the security gate off of Howell Mill Road and around Reservoir No. 2 on the paved drive until reaching the valve box structure. The structure will be on the right.
- Raw Water Pump Station (**CRITICAL**) – **The inflow to Reservoir No. 1 should be ceased in the event of a breach. This can be accomplished by shutting down the Raw Water Pumps or isolating the raw water main from Reservoir No. 1.** From Downtown Atlanta, proceed on I-75 North, take Exit 254 - Moores Mill Road and turn left. Continue on Moores Mill Road for 1.75 miles and turn right onto Marietta Blvd. NW. Turn right into the RM Clayton WRC (Plant St. NW). Proceed through security and turn left onto Coronet Way NW, turn right and proceed under a railroad trestle. The Raw Water Pump Station is on the left. Coordination may be required with the Chattahoochee WTP and RM Clayton WRC for access.

EAP Overview

Red Line (Dashed) = Event Escalated

Green Line (Dashed) = Event De-Escalated

Summary of EAP Process

There are four steps that must be followed anytime an unusual or emergency event is detected at Atlanta Reservoir No. 1 Dam. The steps are:

Step 1 - Event Detection and Level Determination

During the initial step, an unusual event or emergency event is detected at the dam and classified by the EAP Coordinator into one of the following event levels:

Event Level 1, GREEN: Unusual Event, slowly developing

Event Level 2, YELLOW: Emergency Event, potential dam failure situation, rapidly developing

Event Level 3, RED: Urgent!! Emergency Event, dam failure imminent or is in progress

Step 2 - Notification and Communication

After the event level has been determined, notifications are made in accordance with the appropriate notification flow chart provided in STEP 2 of this EAP.

Step 3 - Remedial Actions

After the initial notifications are made, the EAP Coordinator should confer with the site Engineer of Record and the Georgia Safe Dams Program to develop and execute appropriate preventative actions. During this step of the EAP, there is a continuous process of taking actions, assessing the status of the situation, and keeping others informed through the communication channels established during the initial notifications. The EAP may go through multiple event levels during Steps 2 and 3 as the situation either improves or worsens.

Step 4 - Termination and Follow-up

Once the event has ended or been resolved, termination and follow-up procedures should be followed as outlined in Step 4 of this EAP. EAP operations can only be terminated after completing operations under Event **Level 3** or **Level 1**. If Event **Level 2** is declared, the operations must be reclassified to Event **Level 1** or **Level 3** before terminating the EAP operations.

Step 1: Event Detection and Level Determination

Event Detection

Routine surveillance, observation, and/or instrumentation readings at the site will be the normal methods of detecting potential emergency situations. Unusual or emergency events may be detected by:

- Observations at or near the dam
- Evaluation of instrumentation data (if applicable)
- Earthquakes felt or reported in the vicinity of the dam
- Forewarning of conditions that may cause an unusual event or emergency event at the dam (for example, a severe weather or flash flood forecast)

Emergency Level Definitions

Level 1, GREEN Unusual Event - Slowly developing

This classification indicates a situation is developing, but has not yet threatened the operation or structural integrity of the dam. The Owner's technical representatives, Rob Bocarro, P.E. (City of Atlanta, Department of Watershed Management) and Ben Rabun P.E. (Volkert, Inc.), Schnabel Engineering, LLC – EOR (Subconsultant to Volkert, Inc.), AND the Georgia Safe Dams Program should be contacted to investigate the situation and recommend remedial actions. The condition of the dam should be closely monitored, especially during storm events, to detect any development of a potential or imminent dam failure situation.

Level 2, YELLOW Emergency - Potential dam failure situation, rapidly developing

This classification indicates that a situation is developing that could lead to dam failure, but there is not an immediate threat of dam failure. The EAP Coordinator should closely monitor the condition of the dam and periodically report the status of the situation to the Georgia Safe Dams Program, Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response, and Rob Bocarro, P.E., the dam's technical representatives. A reasonable amount of time is available for analysis before deciding on evacuation of downstream residents. If the dam condition worsens and failure becomes imminent, the Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response must be notified immediately of the change in the emergency level to allow sufficient time to evacuate the people at risk downstream. If time permits, the Owner's technical representative (Rob Bocarro, P.E.), other technical representatives, and the Georgia Safe Dams Program should be contacted to evaluate the situation and recommend remedial actions to prevent failure of the dam. The dam operator should initiate remedial measures, only after contacting the Georgia Safe Dams Program and technical representative, to prevent further degradation of the dam utilizing local resources that may be available. (See Appendix B-1)

Level 3, RED Emergency – Urgent!! Dam failure is imminent or is in progress

This is an extremely urgent situation when a dam failure is occurring or is about to occur and likely cannot be prevented. Flash flooding will occur downstream of the dam. The dam owner WILL contact 911 and an order for evacuation of residents in potential inundation areas shall be issued by the Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response.

See the following pages for guidance in determining the proper emergency level for various situations.

Examples of Emergency Situations

The following are examples of conditions that usually constitute an emergency situation that may occur at a dam. Adverse or unusual conditions that can cause the failure of a dam are typically related to aging or design and construction oversights. Extreme weather events that exceed the original designed conditions can cause significant flow through the auxiliary spillway or even overtopping of the embankment. However, accidental or intentional damage to the dam may also result in emergency conditions. The conditions have been grouped to identify the most likely emergency-level condition. The groupings are provided as **guidance only**. Not all emergency conditions may be listed, and the dam owner/operator is urged to use conservative judgment in determining whether a specific condition should be defined as an emergency situation at the dam.

Pre-existing conditions on this dam: Reservoir No. 1 was taken out of service in the early 1990s due to observed seepage and soil migration in the lower natural streambed. A depressed area was discovered in Reservoir No. 1 after the dam was raised an additional five (5) feet and the reservoir was in the process of refilling. It was returned to service in May 2017 following corrective action. Upon refilling of the reservoir to elevation 975.00 MSL (full pool), seepage was observed on the downslope. The level was lowered to 970.00 MSL to relieve pressure on the dam. Several mature hardwoods are rooted into the northern slope of the dam. On occasion, one will fall exposing the root structure. These occurrences are quickly remediated. Records of previous inspections were not available for reference.

Emergency/Auxiliary Spillway Flows

Emergency Level 1 – Potential downstream flooding situation; slowly developing:

1. Reservoir water surface elevation at auxiliary spillway crest or spillway is flowing with no active erosion.

Emergency Level 2 - Potential dam failure situation; rapidly developing:

1. Spillway flowing with active gully erosion or flow that could result in flooding of people downstream if the reservoir level continues to rise.

Emergency Level 3 - Urgent; dam failure appears imminent or is in progress:

1. Significant erosion or headcutting of the spillway is occurring at a rapid rate, and a breach of the spillway appears imminent.

Embankment Overtopping

Emergency Level 2 – Potential dam overtopping situation; rapidly developing:

1. The reservoir level is rising and approaching the crest of the dam and could begin overtopping if sufficient freeboard does not exist.

Emergency Level 3 - Urgent; dam failure appears imminent or is in progress:

1. The reservoir level has exceeded the top of the dam, and flow is going over the crest of the embankment.

Seepage and Sinkholes

Emergency Level 1 – Potential seepage increases; slowly developing:

1. New or increased areas of wet or muddy soils are present on the downstream slope, abutment, and/or toe of the dam, and there is an easily detectable and unusual increase in volume of downstream seepage.

Emergency Level 2 - Potential dam failure situation; rapidly developing:

1. Cloudy seepage or soil deposits are observed at seepage exit points or from internal drain outlet pipes.
2. Significant new or enlarging sinkhole(s) near the dam or settlement of the dam is observed.
3. Reservoir level is falling without an apparent cause.
4. The following known dam defects are or will soon be inundated by a rise in the reservoir:

* Back-up to primary contact

Step 3: Remedial Actions

After the initial notifications are made, Quinton Fletcher should confer with Rob Bocarro, P.E., the site engineer, Tom Woosley with the Georgia Safe Dams Program, and other Technical Representatives (Ben Rabun, P.E.-Volkert, Inc.; Subconsultant - Schnabel Engineering, LLC – EOR) to develop and execute appropriate preventative actions. Refer to *Appendix B-1: Resources Available* for emergency equipment access and local available contractors. During this step of the EAP, there is a continuous process of taking actions, assessing the status of the situation, and keeping others informed through communication channels established during the initial notifications. The EAP may go through multiple event levels during Steps 2 and 3 as the situation either improves or worsens.

Step 4: Termination

When the emergency situation is over, the EAP operations must be terminated and follow-up procedures completed. EAP operations can only be terminated after completing operations under Event **Level 3** or **Level 1**. If Event **Level 2** is declared, the operations must be designated Event **Level 3** or **Level 1** before terminating the EAP operations.

Termination responsibilities

Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response, in coordination with the Georgia Safe Dams Program and EAP Coordinator, is responsible for terminating the EAP operations and relaying this decision to all parties who are active in EAP operations. It is then the responsibility of each person to notify the same group of contacts that were notified during the original event notification process and inform them that the event has been terminated.

Prior to termination of an Emergency **Level 3** event that has not caused actual dam failure, the Georgia Safe Dams technical representative will inspect the dam and/or require a state certified engineer to inspect the dam and determine whether any damage has occurred that could potentially result in loss of life, injury, or property damage. If it is determined conditions do not pose a threat to human life or property, Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response will be advised to terminate EAP operations as described above.

Quinton Fletcher shall assure that the *Dam Safety Emergency Situation Report* (Appendix A-3) is completed to document the emergency event and all actions taken. Quinton Fletcher shall distribute copies of the completed report to the Georgia Safe Dams Program.

Maintenance—EAP Review and Revision

EAP annual review

Quinton Fletcher will coordinate a review and, if needed, update of the EAP at least once each year. The EAP annual review will include the following:

- Call all contacts on the three notification charts in the EAP to verify that the phone numbers and the contact personnel are current. The EAP will be revised if any of the contacts have changed.
- Contact the local law enforcement agency to verify the phone numbers and persons in the specified positions. In addition, Quinton Fletcher will ask if the person contacted knows where the EAP is kept and if responsibilities described in the EAP are understood.
- Call the locally available resources to verify that the phone numbers, addresses, and services are current.

Revisions

Quinton Fletcher is responsible for updating the EAP document. The EAP document held by Quinton Fletcher is the master document. When revisions occur, Quinton Fletcher will provide the revised pages and a revised revision summary page to all the EAP document holders. The document holders are responsible for revising their outdated copy of the respective document(s) whenever revisions are received. Outdated pages shall be immediately discarded to avoid any confusion with the revisions.

EAP periodic test

Quinton Fletcher will host and facilitate a periodic test of the EAP at least once every 5 years.

The periodic test will consist of a meeting, including a tabletop exercise, conducted at the *Hemphill Water Treatment Plant conference room*. Attendance should include City of Atlanta / Dept. of Watershed Management – Richard Parker, Quinton Fletcher, Georgia Safe Dams Program staff, Atlanta-Fulton County Emergency Management Agency and the City of Atlanta, Department of Watershed Management Emergency Response, at least one representative of the local law enforcement agency, and others with key responsibilities listed in the EAP document. At the discretion of Quinton Fletcher, other organizations that may be involved with an unusual or emergency event at the dam are encouraged to participate. Before the tabletop exercise begins, meeting participants will visit the dam during the periodic test to familiarize themselves with the dam site.

The tabletop exercise will begin with the facilitator presenting a scenario of an unusual or emergency event at the dam. The scenario will be developed prior to the exercise. Once the scenario has been presented, the participants will discuss the responses and actions that they would take to address and resolve the scenario. The narrator will control the discussion, ensuring realistic responses and developing the scenario throughout the exercise. Quinton Fletcher should complete an event log as they would during an actual event.

After the tabletop exercise, the EAP will be reviewed and discussed. Mutual aid agreements and other emergency procedures can be discussed. Quinton Fletcher will prepare a written summary of the periodic test and revise the EAP with assistance from the technical representatives, as necessary.

Appendix A-4 - Glossary of Terms

Abutment	That part of the valley side against which the dam is constructed. The left and right abutments of dams are defined with the observer looking downstream from the dam.
Acre-foot	A unit of volumetric measure that would cover 1 acre to a depth of 1 foot. One acre-foot is equal to 43,560 cubic feet or 325,850 gallons.
Berm	A nearly horizontal step (bench) in the upstream or downstream sloping face of the dam.
Boil	A disruption of the soil surface due to water discharging from below the surface. Eroded soil may be deposited in the form of a ring around the disruption.
Breach	An opening through the dam that allows draining of the reservoir. A controlled breach is an intentionally constructed opening. An uncontrolled breach is an unintended failure of the dam.
Conduit	A closed channel (round pipe or rectangular box) that conveys water through, around, or under the dam.
Control section	A usually level segment in the profile of an open channel spillway above which water in the reservoir discharges through the spillway.
Cross section	A slice through the dam showing elevation vertically and direction of natural water flow horizontally. Also, a slice through a spillway showing elevation vertically and left and right sides of the spillway looking downstream.
Dam	An artificial barrier generally constructed across a watercourse for the purpose of impounding or diverting water.
Dam failure	The uncontrolled release of a dam's impounded water.
Dam Operator	The person(s) or unit(s) of government with responsibility for the operation and maintenance of dam.
Drain, toe or foundation, or blanket	A water collection system of sand and gravel and typically pipes along the downstream portion of the dam to collect seepage and convey it to a safe outlet.
Drainage area (watershed)	The geographic area on which rainfall flows into the dam.
Drawdown	The lowering or releasing of the water level in a reservoir over time or the volume lowered or released over a particular period of time.
Emergency	A condition that develops unexpectedly, endangers the structural integrity of the dam and/or downstream human life and property, and requires immediate action.
Emergency Action Plan (EAP)	A formal document identifying potential emergency conditions that may occur at the dam and specifying preplanned actions to minimize potential failure of the dam or minimize failure consequences including loss of life, property damage, and environmental impacts.
Evacuation map	A map showing the geographic area downstream of a dam that should be evacuated if it is threatened to be flooded by a breach of the dam or other large discharge.

Filter	The layers of sand and gravel in a drain that allow seepage through an embankment to discharge into the drain without eroding the embankment soil.
Freeboard	Vertical distance between a stated water level in the reservoir and the top of dam.
Gate, slide or sluice, or regulating	An operable, watertight valve to manage the discharge of water from the dam.
Groin	The area along the intersection of the face of a dam and the abutment.
Height, dam	The vertical distance between the lowest point along the crest of the dam and the lowest point at the downstream toe, which usually occurs in the bed of the outlet channel.
Hydrograph, inflow or outflow, or breach	A graphical representation of either the flow rate or flow depth at a specific point above or below the dam over time for a specific flood occurrence.
Incident Commander	The highest predetermined official available at the scene of an emergency situation.
Instrumentation	An arrangement of devices installed into or near dams that provide measurements to evaluate the structural behavior and other performance parameters of the dam and appurtenant structures.
Inundation area	The geographic area downstream of the dam that would be flooded by a breach of the dam or other large discharge.
Notification	To immediately inform appropriate individuals, organizations, or agencies about a potentially emergency situation so they can initiate appropriate actions.
Outlet works (principal spillway)	An appurtenant structure that provides for controlled passage of normal water flows through the dam.
Piping	The progressive destruction of an embankment or embankment foundation by internal erosion of the soil by seepage flows.
Probable Maximum Precipitation (PMP) or Flood (PMF)	The theoretically greatest precipitation or resulting flood that is meteorologically feasible for a given duration over a specific drainage area at a particular geographical location.
Reservoir	The body of water impounded or potentially impounded by the dam.
Riprap	A layer of large rock, precast blocks, or other suitable material, generally placed on an embankment or along a watercourse as protection against wave action, erosion, or scour.
Risk	A measure of the likelihood and severity of an adverse consequence.
Seepage	The natural movement of water through the embankment, foundation, or abutments of the dam.
Slide	The movement of a mass of earth down a slope on the embankment or abutment of the dam.
Spillway (auxiliary or emergency)	The appurtenant structure that provides the controlled conveyance of excess water through, over, or around the dam.

Spillway capacity	The maximum discharge the spillway can safely convey with the reservoir at the maximum design elevation.
Spillway crest	The lowest level at which reservoir water can flow into the spillway.
Tailwater	The body of water immediately downstream of the embankment.
Toe of dam	The junction of the upstream or downstream face of an embankment with the ground surface.
Top of dam (crest of dam)	The elevation of the uppermost surface of an embankment which can safely impound water behind the dam.

Appendix B-2 - Inundation Maps

An inundation study was conducted for the City of Atlanta by Black & Veatch using TUFLOW (XP-SWMM) 2D to determine a representative hydrograph and develop an inundation model.

The inundation maps generated for each breach scenario of the Reservoir No. 1 Dam are included as attachments to this Appendix.

Bridges, culverts, or other restraining features along the inundation flow paths were surveyed and their locations are indicated in the following map and table.

Assumptions used in the inundation study are as follows:

- Inundation limits are based on a breach occurring during the 6-hour 50% Probable Maximum Precipitation (PMP) and during a fair weather (“sunny day”) event.
- Four (4) breach locations were modeled. These locations were selected based on four (4) possible flow paths. A breach could occur at any location along the reservoir embankment. Three (3) breach scenarios were modeled: 1 North, 1 East, and 1 South. Breach paths 1A and 1B as seen in Appendix B-6 were modeled as Scenario 1 North.
- HEC-RAS was used for modeling the breach and calculating the breach hydrographs. The breach parameters are defined based on the Froehlich equations as described on the State of Georgia Engineering Guidelines. The pipe that connects the two reservoirs was assumed to be open during the breach. The breach was assumed to initiate at the moment when the maximum water surface elevation is reached during the 6-hour 50% PMP.
- The XP-SWMM modeling software was used to perform coupled 2D and 1D hydraulic simulations. The TUFLOW and EXTRAN hydraulic model engines were used for the 2D and 1D hydraulic computations respectively. Peachtree Creek, Tanyard Creek and Woodall Creek were modeled as 1D channels, while the floodplain adjacent to these channels and the area surrounding the reservoirs were modeled using the 2D component.
- The runoff resulting from the 6-hour 50% PMP was modeled simultaneously to the breach hydrograph.
- The TUFLOW model uses the 2015 DEM base terrain model to route the PMP and dam breach flows.

The reservoir is pumped storage for the adjacent Hemphill Water Treatment Plant. The drainage area is slightly larger than the surface area of the reservoir. The approximate extents of the drainage basin are included in the map herein below.

Appendix B-5 - Evacuation Map

Routes indicated on the attached *Atlanta Reservoir No. 1 Dam Breach Evacuation Maps* are identified to safely and expeditiously direct traffic away from the inundation area and to primary roadways with sufficient capacity to accept additional traffic. By directing traffic to primary roadways, congestion on the marked routes can be minimized and more easily managed. The primary evacuation routes include the following:

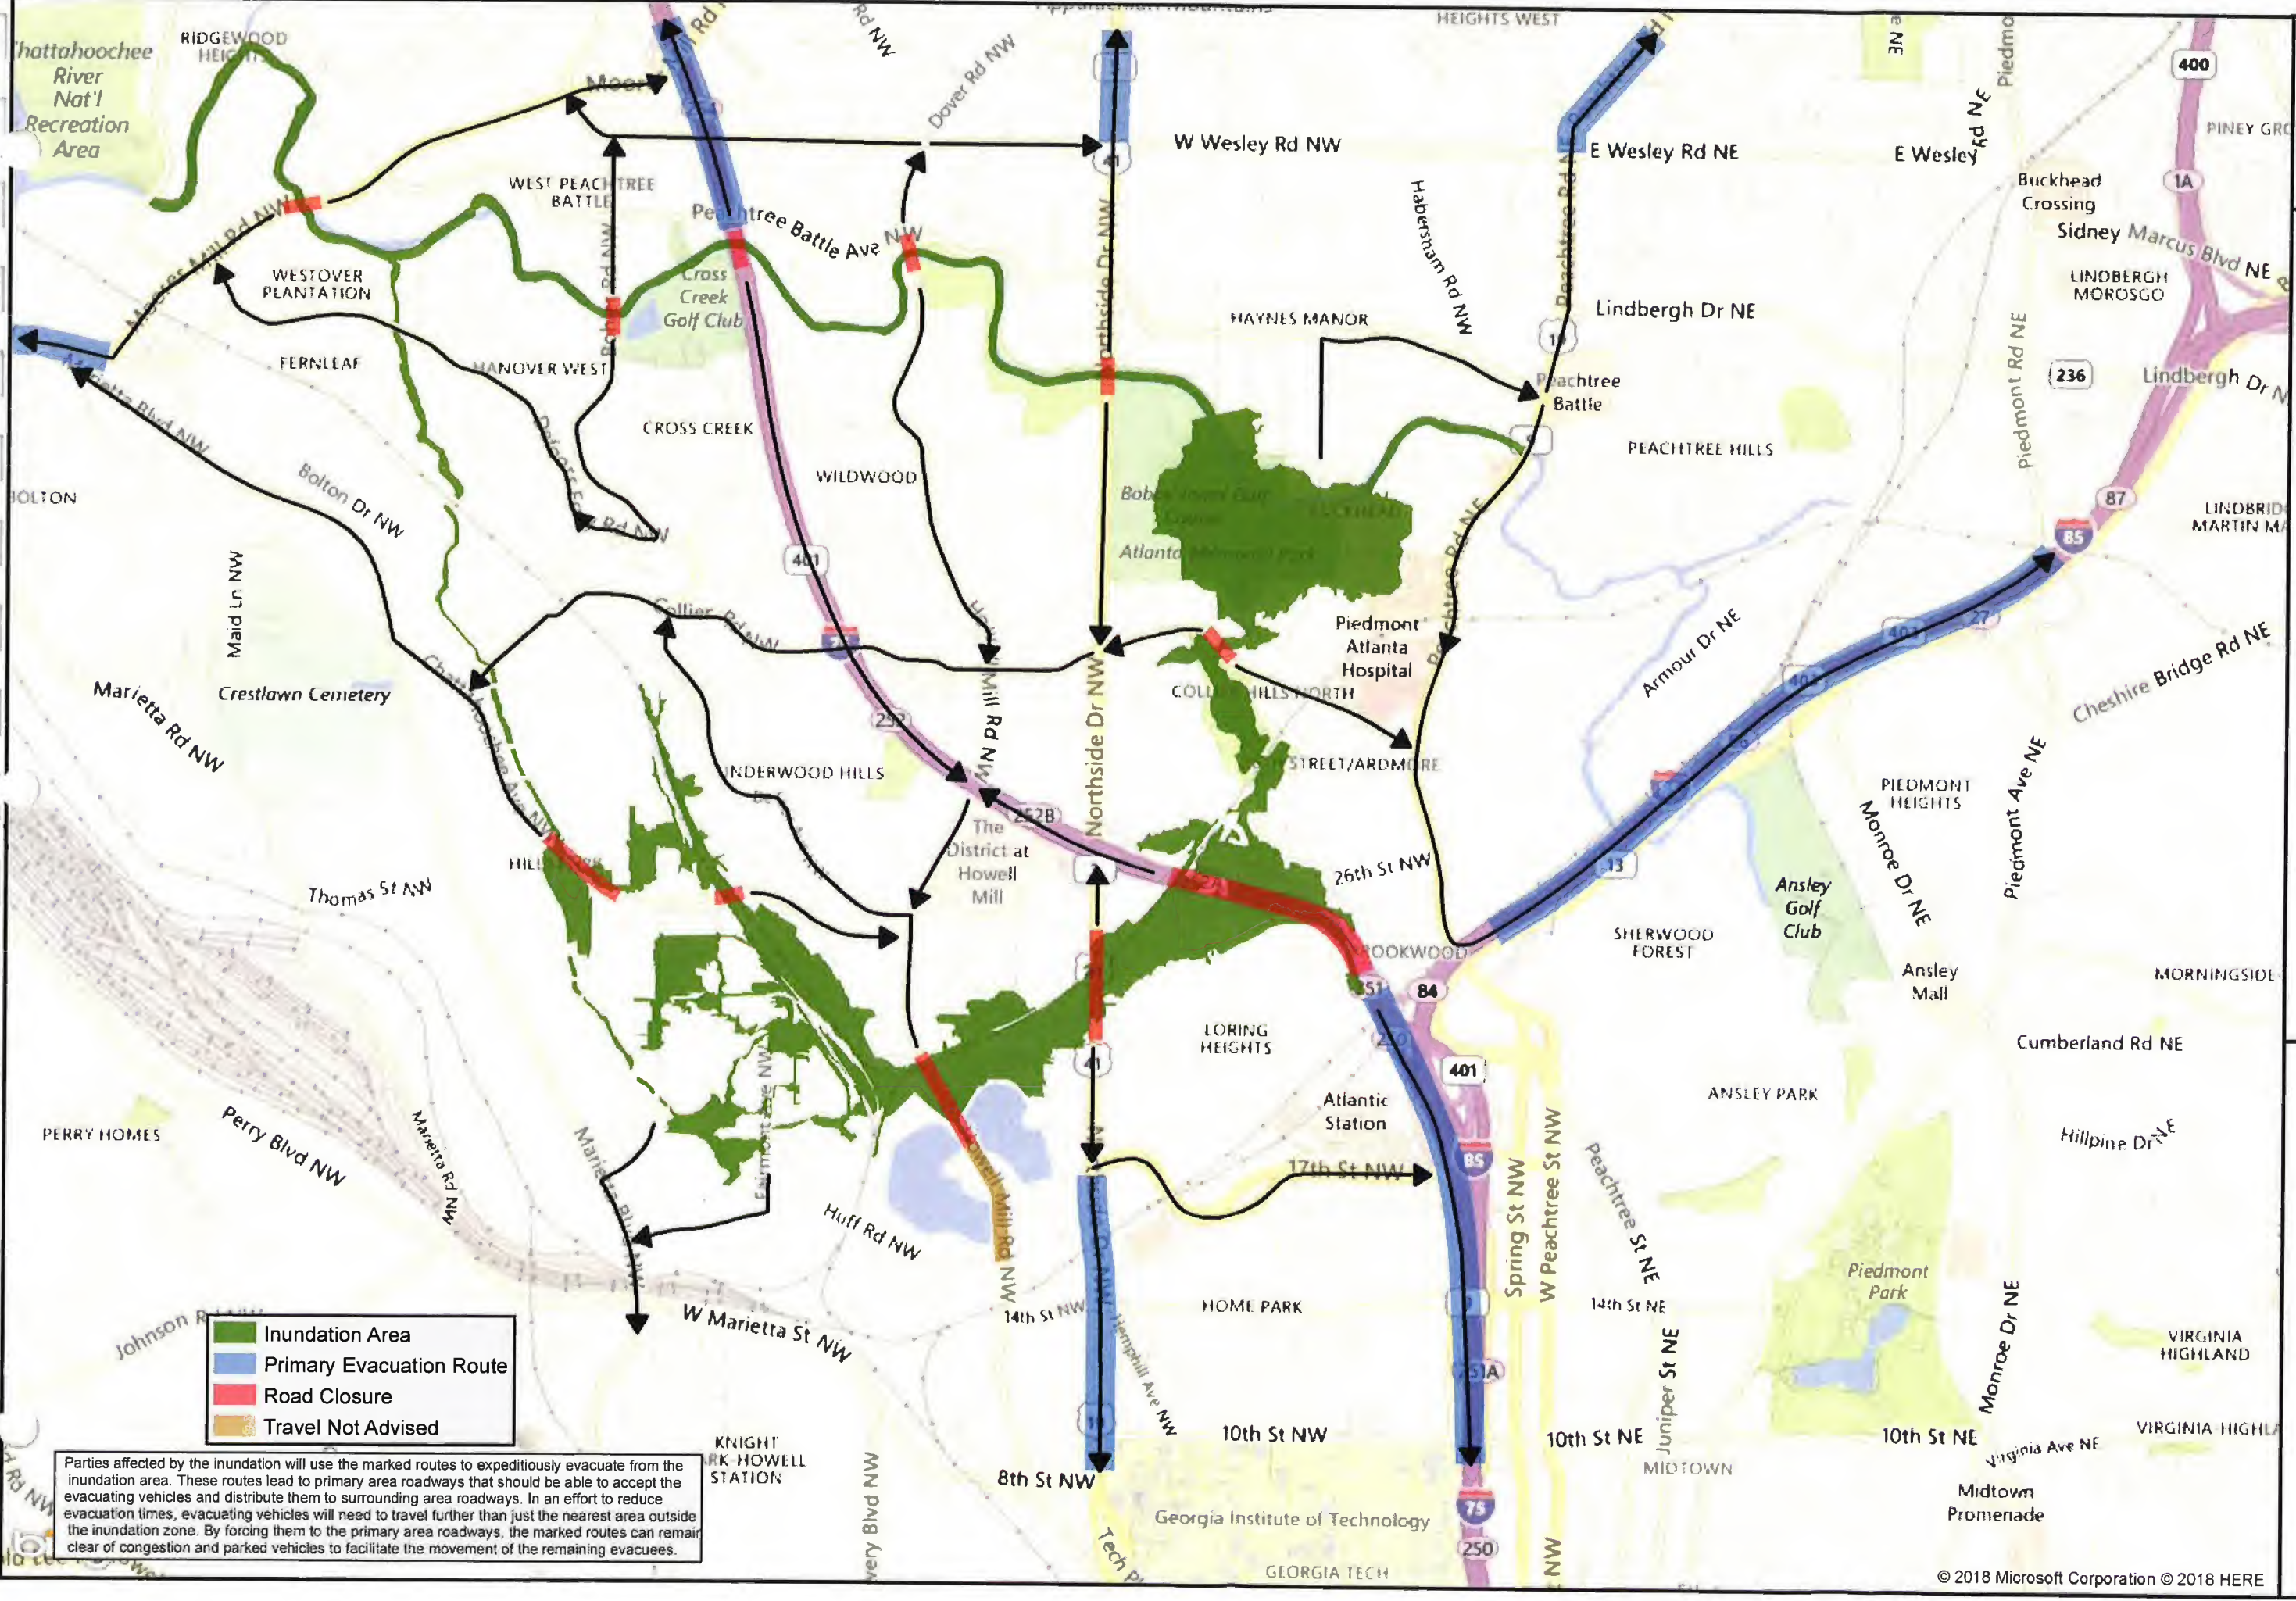

- Interstate 85 east of the inundation area
- Moores Mill Rd NW ↔ Northside Drive NW ↔ Peachtree Rd NE north of the inundation area
- Interstate 75 to the north of the inundation area
- Interstate 75/85 Connector south of the inundation area

The approximate flood wave anticipated arrival time relative to primary roadway within the inundation area are include in the following matrix. Refer to *Appendix B-6* for additional travel time information.

*Arrival time shown is the shortest approximate arrival time of the fair-weather and wet-weather conditions.

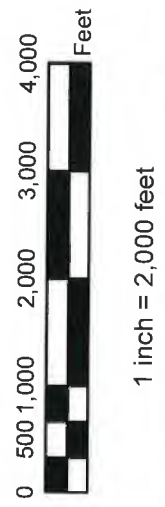

The primary evacuation routes will function as detour routes throughout the event until impacted roadways are determined by law enforcement to be accessible. Traffic will be able to travel in both directions on the designed evacuation route roadways. Detours will consist of standard MUTCD signage along with special signs describing road names, if necessary. Detours will be coordinated with GDOT, as many of the evacuation roadways are part of the state network.

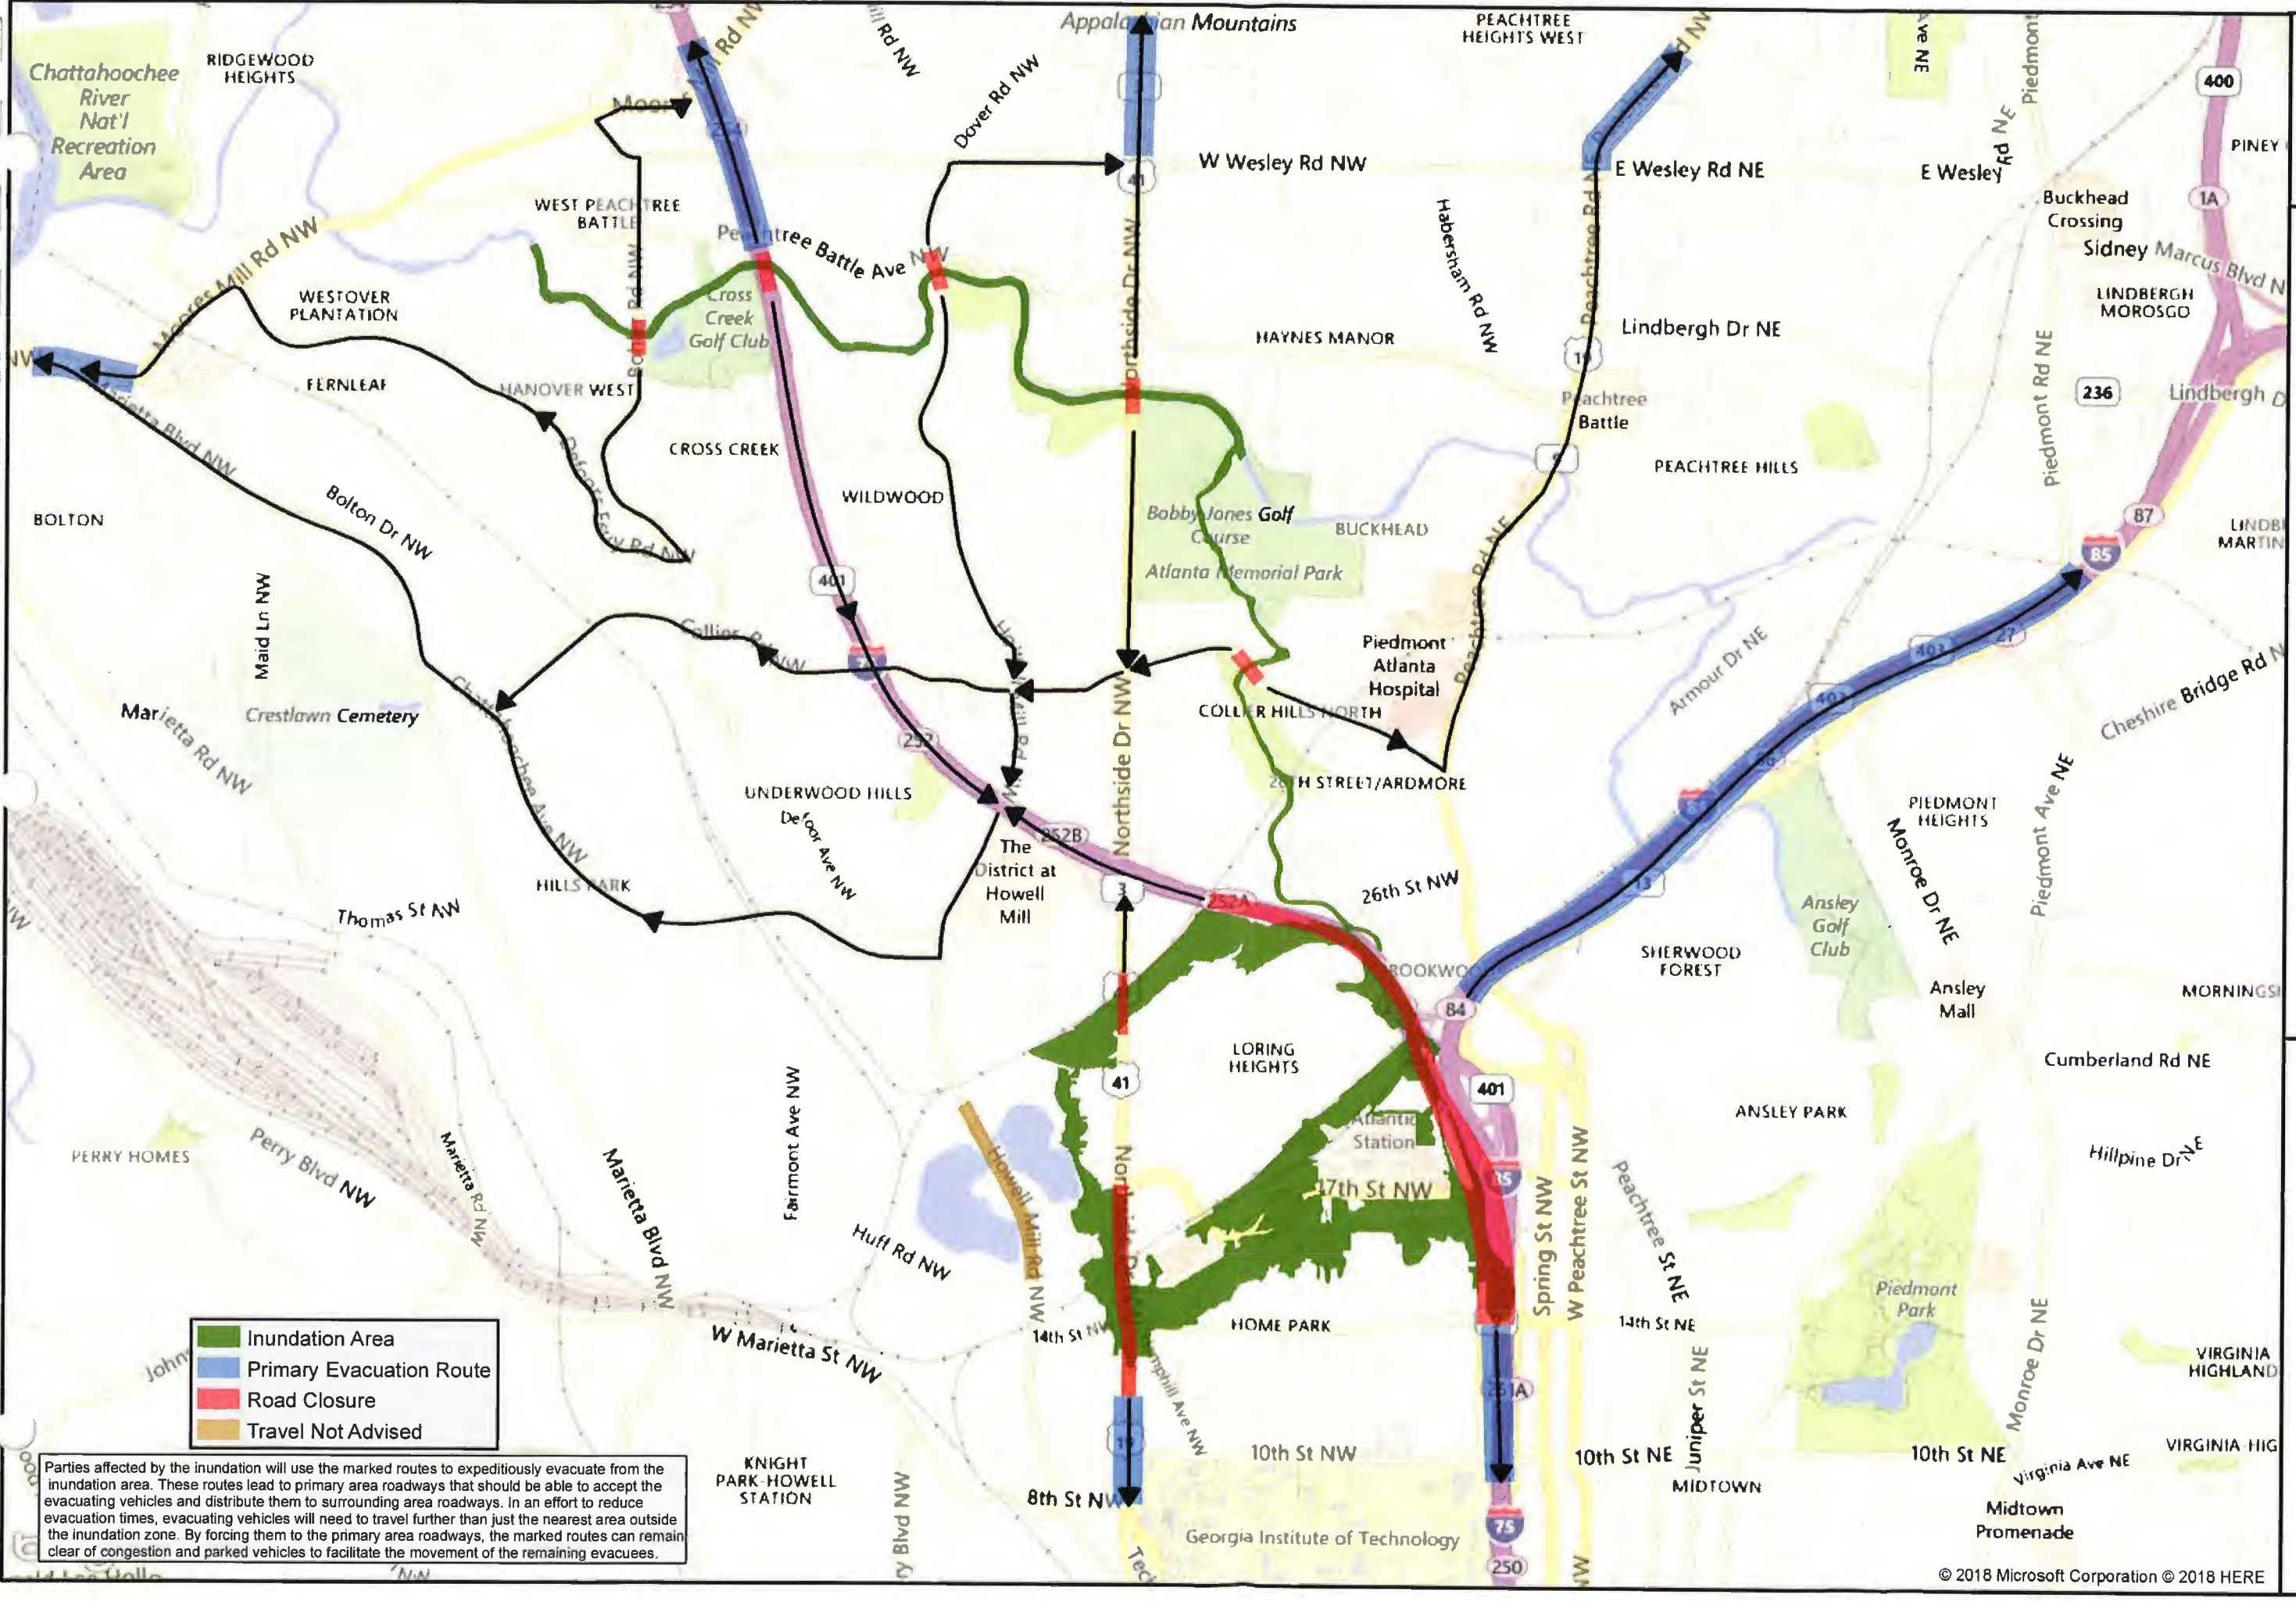

Parties affected by the inundation will use the marked routes to expeditiously evacuate from the inundation area. These routes lead to primary area roadways that should be able to accept the evacuating vehicles and distribute them to surrounding area roadways. In an effort to reduce evacuation times, evacuating vehicles will need to travel further than just the nearest area outside the inundation zone. By forcing them to the primary area roadways, the marked routes can remain clear of congestion and parked vehicles to facilitate the movement of the remaining evacuees.

Appendix B-6 - Residents/Businesses/Highways at Risk

A major flood caused by a sudden breach of the dam is estimated to inundate a large number of residents, businesses, and roadways as indicated in the table below. These homes and businesses are located primarily east of Marietta Blvd NW and along the Tanyard Creek channel to confluence with Peachtree Creek for the north breach. For the south breach, the impacted homes and business are located south of 17th Street to and along Interstate 75/85 continuing along the Tanyard Creek channel to approximately Collier Road. For the east breach, the impacted homes and business are located south of 17th Street to and along Interstate 75/85 as well as north of Atlantic Station near 20th Street and in the railway west of Interstate 75 and north of the reservoir. The area is undergoing redevelopment, thus the characteristics of the parcels at risk and the principal contacts are anticipated to change. The plan should be updated annually, at a minimum, to reflect changes.

Scenario	At Risk Entities by Type					
	Commercial	Mixed-Use	Industrial	Single Family Residential	Railroads	Roadways
North	8	61	107	1,058	2	10
South	8	56	23	1,845	1	8
East	6	52	23	1,072	1	9

*Approximate values above were determined by parcel zoning codes per the City of Atlanta

As the travel time for the flood wave is approximate, residents and businesses at risk should immediately evacuate upon notice to do so.

A shapefile corresponding with the inundation area has been provided to the Atlanta-Fulton EMA and DWM Emergency Response for rapid reference of impacted parcels. Rapid notification may occur through the EMA.

House/ business/ road no.*	Resident/ business/ road	Address	Phone no.*	Distance downstream from dam (ft)	Travel time** (hr)	Max water depth above first floor*** (ft)
Due to the large number of impacted parcels, a complete list has been provided as Appendix B-6A Residents/Businesses/Highways at Risk and is included herein below and on the following pages.						

See Appendix B-2 and B-3 for a complete table of parcel information.

* Phone No. – Available phone numbers have been included.

** Estimated time for breach wave (arrival) to travel from dam to downstream locations.

***Max water depth above first floor is not be included. Conservatively, all parcels impacted by any level of inundation are included in the list.

Basis for computation of evacuation area and flooding depths

Breach inundation modeling and analysis was performed by Black & Veatch in February 2018.

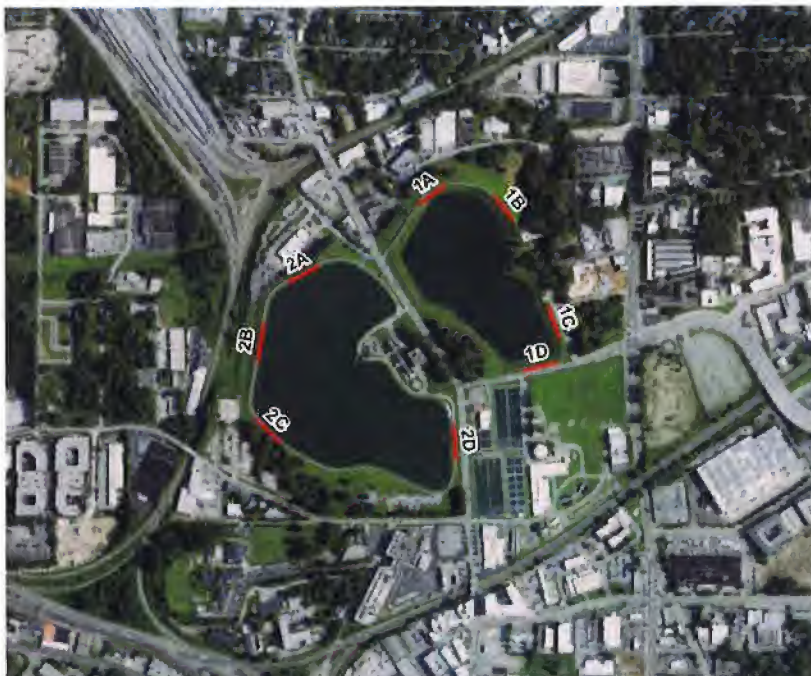

Hydraulic model used: TUFLOW (XP-SWMM) 2D

Model assumptions:

- Breach during 50% PMP (precipitation falling directly on Reservoir); Inflow Peak = 802 cfs
- Water surface elevation in reservoir prior to breach = 978.27 (top spillway – 976.50) – *Note: Reservoir is pumped storage and not generally operated above the spillway elevation.*
- Downstream area defined by a digital terrain model, terrain model resolution within hydraulic model is 30'x30' for fair weather conditions and 40' x 40' under wet-weather conditions.
- The table and figure below indicate breach locations and assumptions made in the inundation study per breach location.

Appendix B-8 Figure 2 - Atlanta Reservoir No. 1 - Auxiliary Spillway

Appendix B-9 - Reservoir Elevation-area-volume and Spillway Capacity Data

Note: Reservoir No. 1 is pumped storage for the Hemphill Water Treatment Plant. The level is maintained below the invert of the auxiliary spillway. There is no principal spillway. Discharge from the auxiliary spillway would only occur if the raw water pumps filled the reservoir above 976.50 MSL. In this situation, the discharge would be approximately equivalent to the raw water pumping rate.
